

# **Opportunities and Challenges for a shared, cooperative satellite AIS system**

**Jeroen Rotteveel**  
**CANEUS-CSSP International Workshop**

**October 21, 2010**  
**Marina di Carrara, Italy**

- Spin-off of Delfi-C3 nanosatellite project of TU Delft
- Founded January 06, 2006
- Office locations:
  - Delft, near Delft University of Technology Campus
  - Noordwijk, in the European Space Incubator at ESTEC
- Current team: 20+ engineers, plus management, support

# Innovative Data Services

- Founded July 2009
- Spin-off from small satellite and RF payload builder ISIS
- Experienced advisory board
- Most Promising Startup 2010 ESA/ESINET
- Offices in the Netherlands
  - Delft, campus TU Delft
  - Noordwijk, campus ESTEC
- Supported by ESA and YES!Delft

# Sharing position knowledge with your knowing where you are is not enough surroundings is important

you are here

#### Solution:

Cell phone cell density, wifi and radio feeds to locate and communicate congestion

#### Enables:

- Improved knowledge on congestion
- Ability to take an alternative route

you are here

#### Solution:

IMO mandated transponder system improves local information needs for safety

#### Enables:

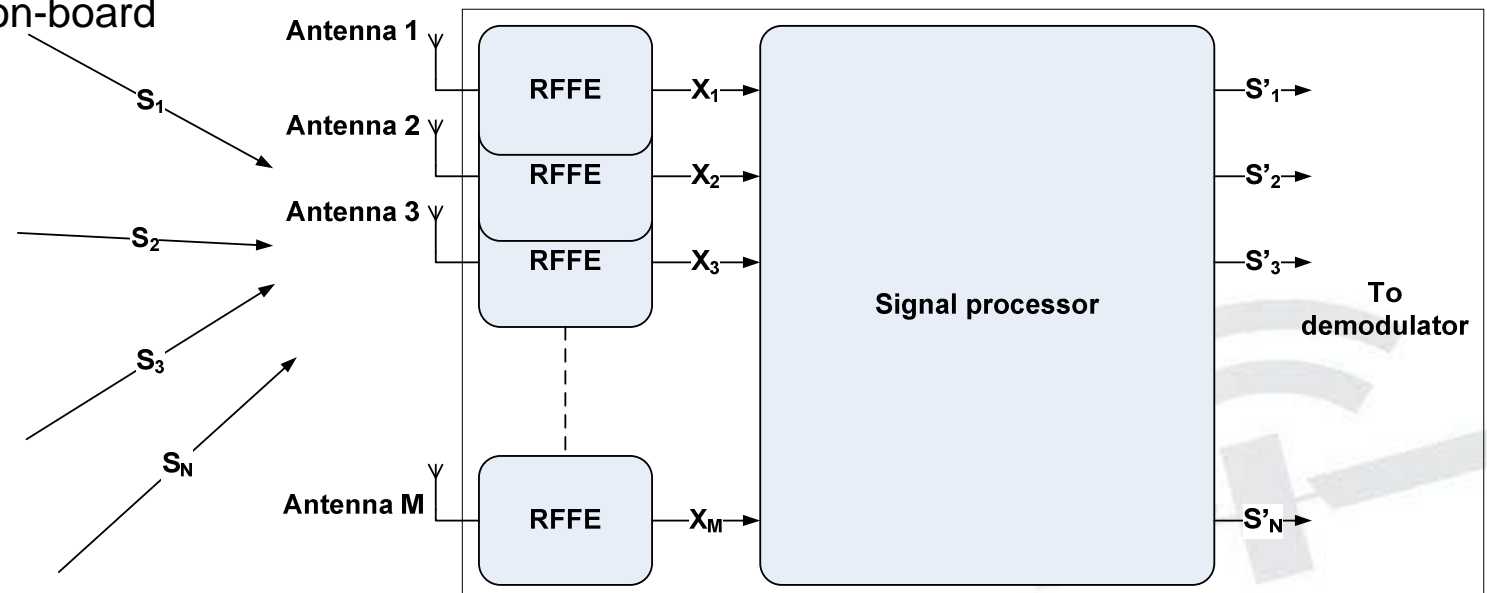

- Improved situational awareness
- Routing and logistic services near ports

# Operational Concept

# Payload Technology

- Decollision of overlapping messages
- (acceptable performance in high traffic zones)
- Robustness against interference
- Low power and mass, so suitable for micro- and nanosatellites
- All processing, demodulation and decoding on-board
- Scalability
- No antenna calibration required
- No complex antennas required; high performances are achieved with simple monopoles or dipole antennas
- Reduced algorithm complexity
- No footprint reduction

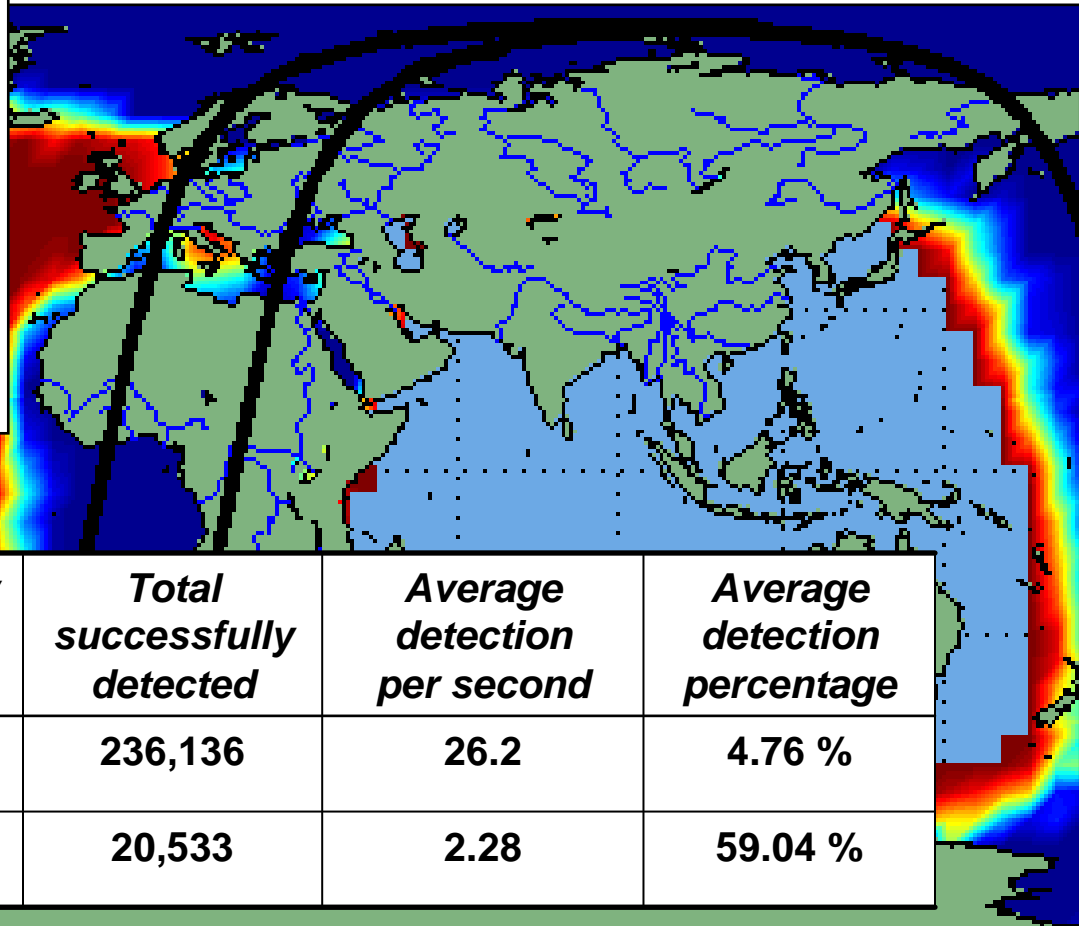

# Expected Performance

- Very dependent on the scenario
- Example: Mediterranean
  - 150 minutes of flight time  
(2 passes over the Mediterranean)
  - 1 Spacecraft
    - 4 antennas
    - 500 kilometers altitude
    - 98° elevation
  - 70,000 ships
    - - Class A ships only
    - - 50.000 uniform distributed
    - - 9.500 Europe (additional)
    - - Rest: America / Asia
    - Reporting Rate:
      - 16.7 % - 3.3 seconds
      - 41.7 % - 6.0 seconds
      - 41.7 % - 10.0 seconds

# Expected Results

	<i>Total seen by satellite</i>	<i>Total successfully detected</i>	<i>Average detection per second</i>	<i>Average detection percentage</i>
<b>Messages:</b>	<b>4,963,795</b>	<b>236,136</b>	<b>26.2</b>	<b>4.76 %</b>
<b>Ships:</b>	<b>34,776</b>	<b>20,533</b>	<b>2.28</b>	<b>59.04 %</b>

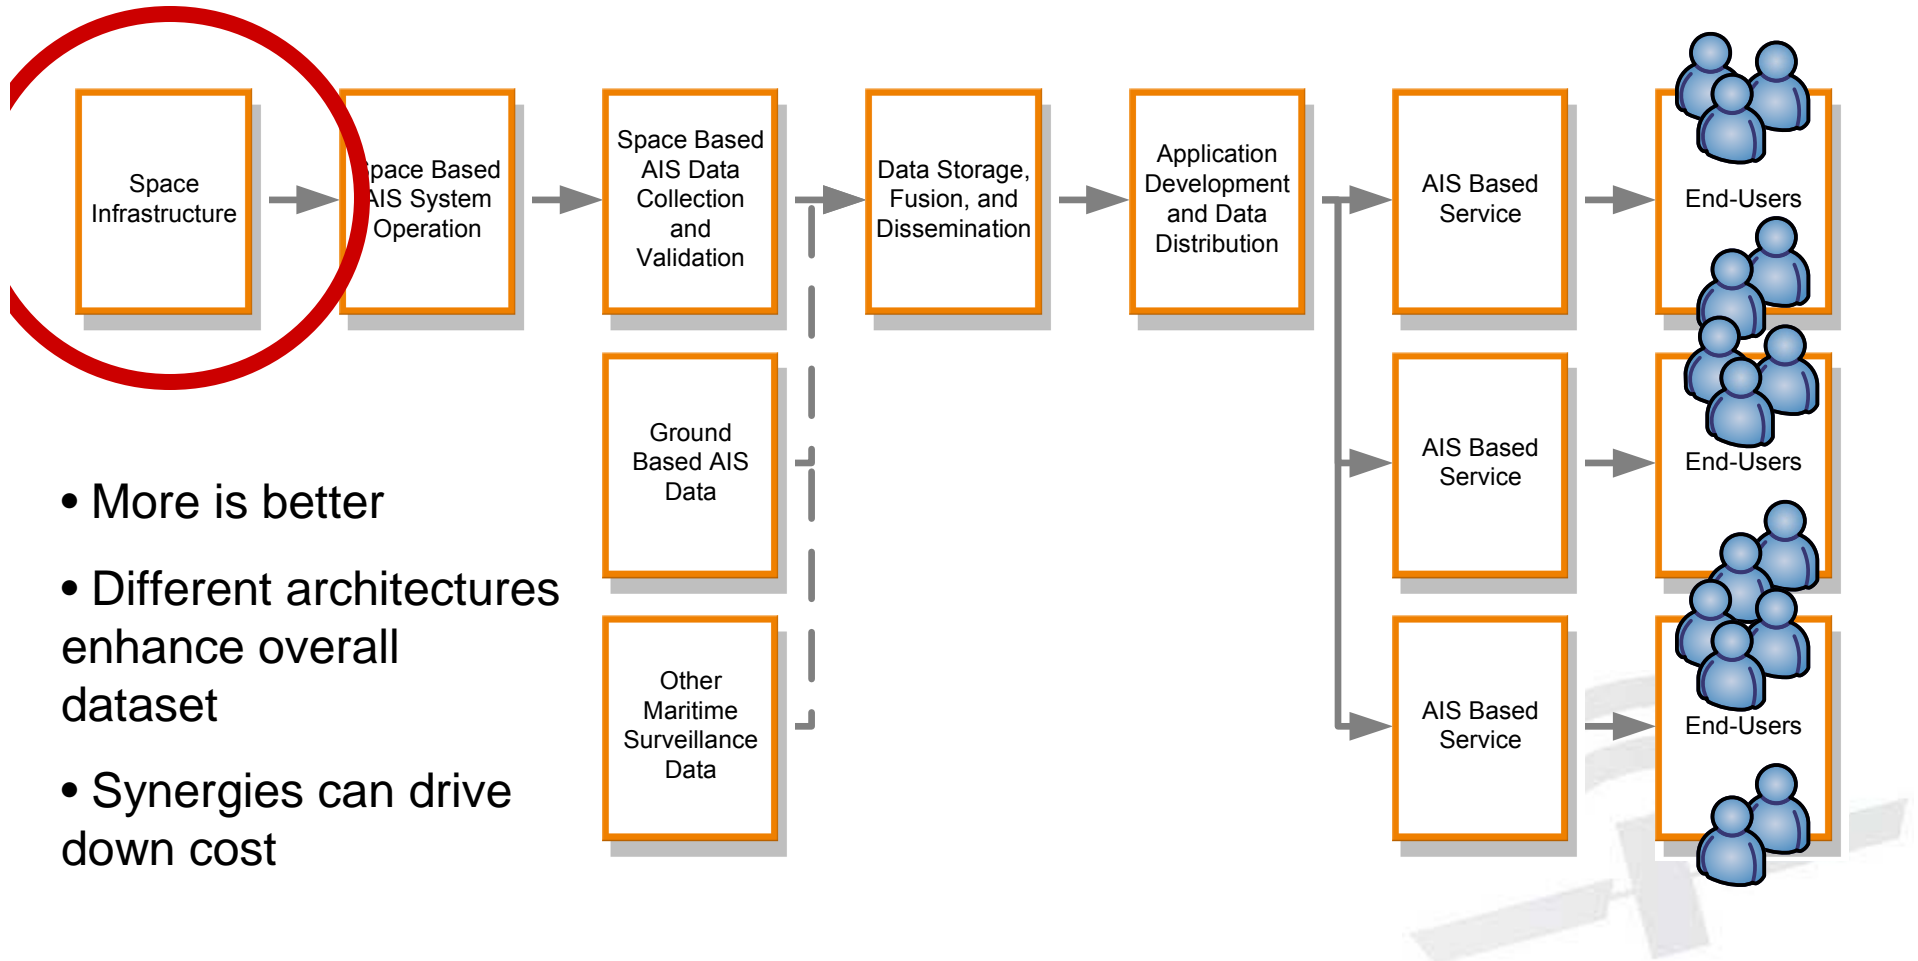

## AIS System Implementation

- *A network of nanosatellites is proposed to fulfil the user requirements at moderate cost:*
  - *4 sun-synchronous orbital planes*
  - *Minimum of 3 satellites per orbital plane*
  - *Constellation altitude between 500 – 800 kilometres*
  - *Use of a network of ground stations for to obtain low data latency*

# Organization and implementation

- More is better
- Different architectures enhance overall dataset
- Synergies can drive down cost

# CubeSat Design Philosophy

Why is it so popular

- Standard form factor
- Open innovation, IPR sharing
- Low Cost Systems
- Modular systems based on harmonized interfaces
- Availability of off-the-shelf parts
- Sharing of groundstations (GENSO)
- Sharing launches (cluster launches)

1 kg, 1W

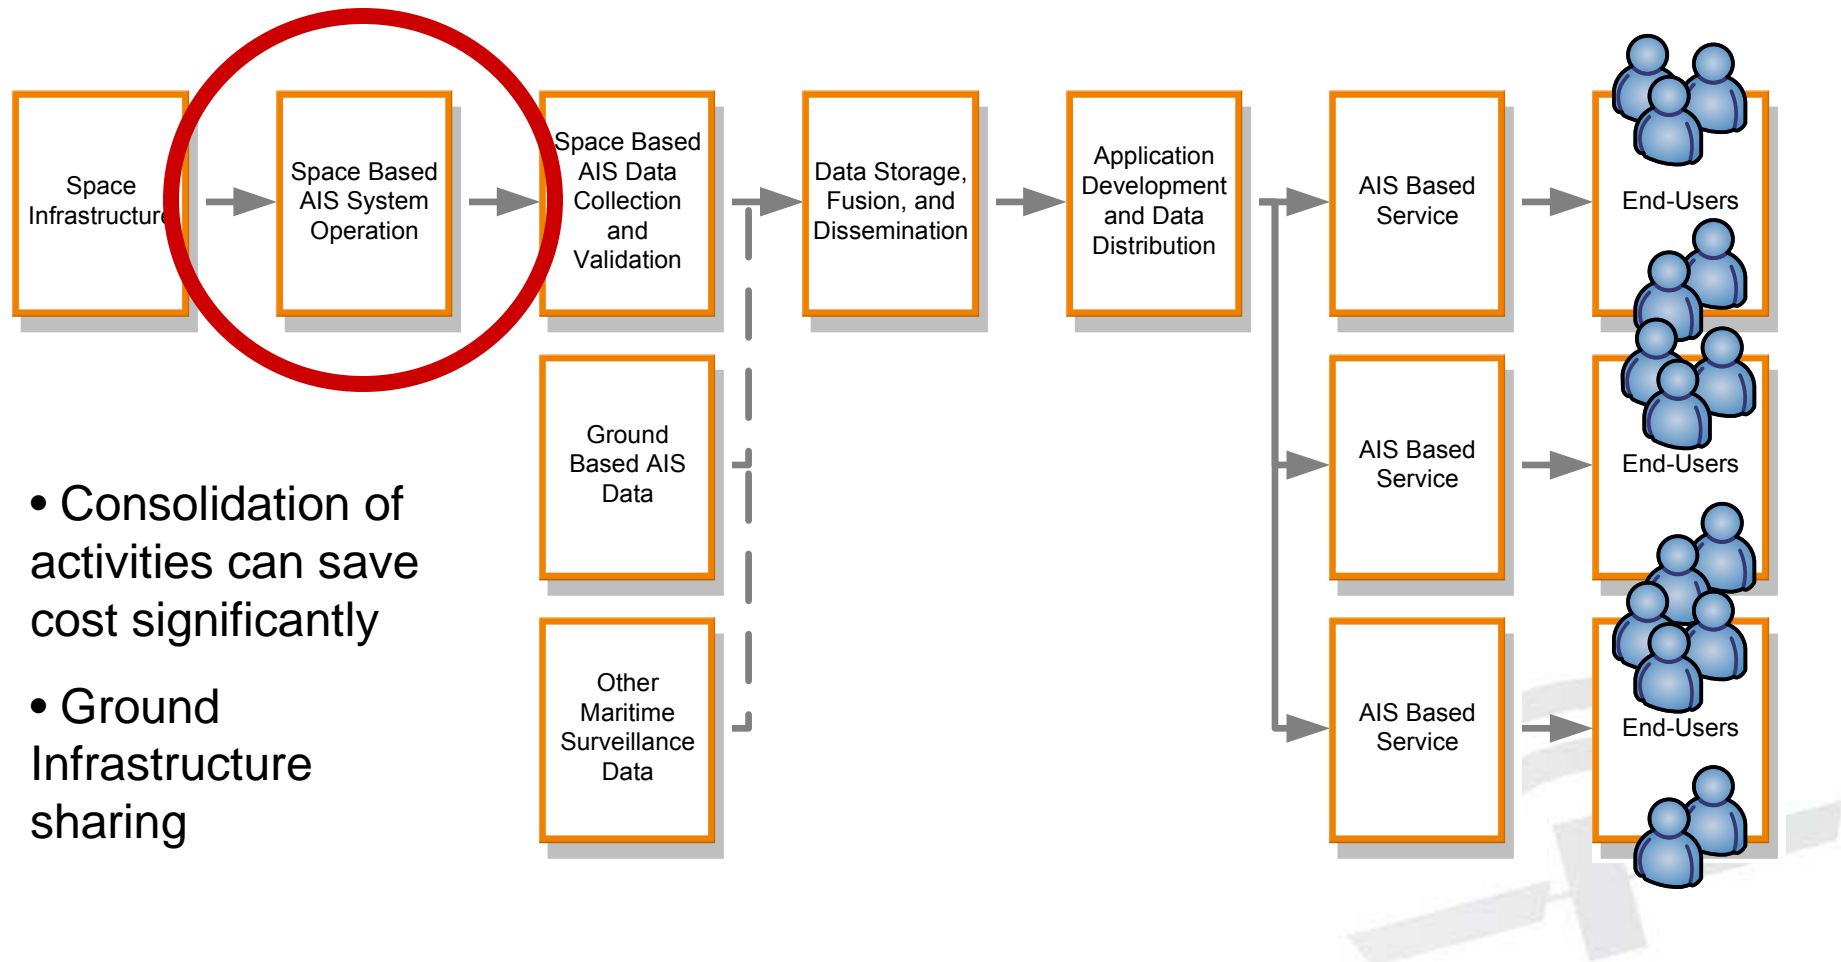

20 kg, 40W

What could be done for S-AIS:

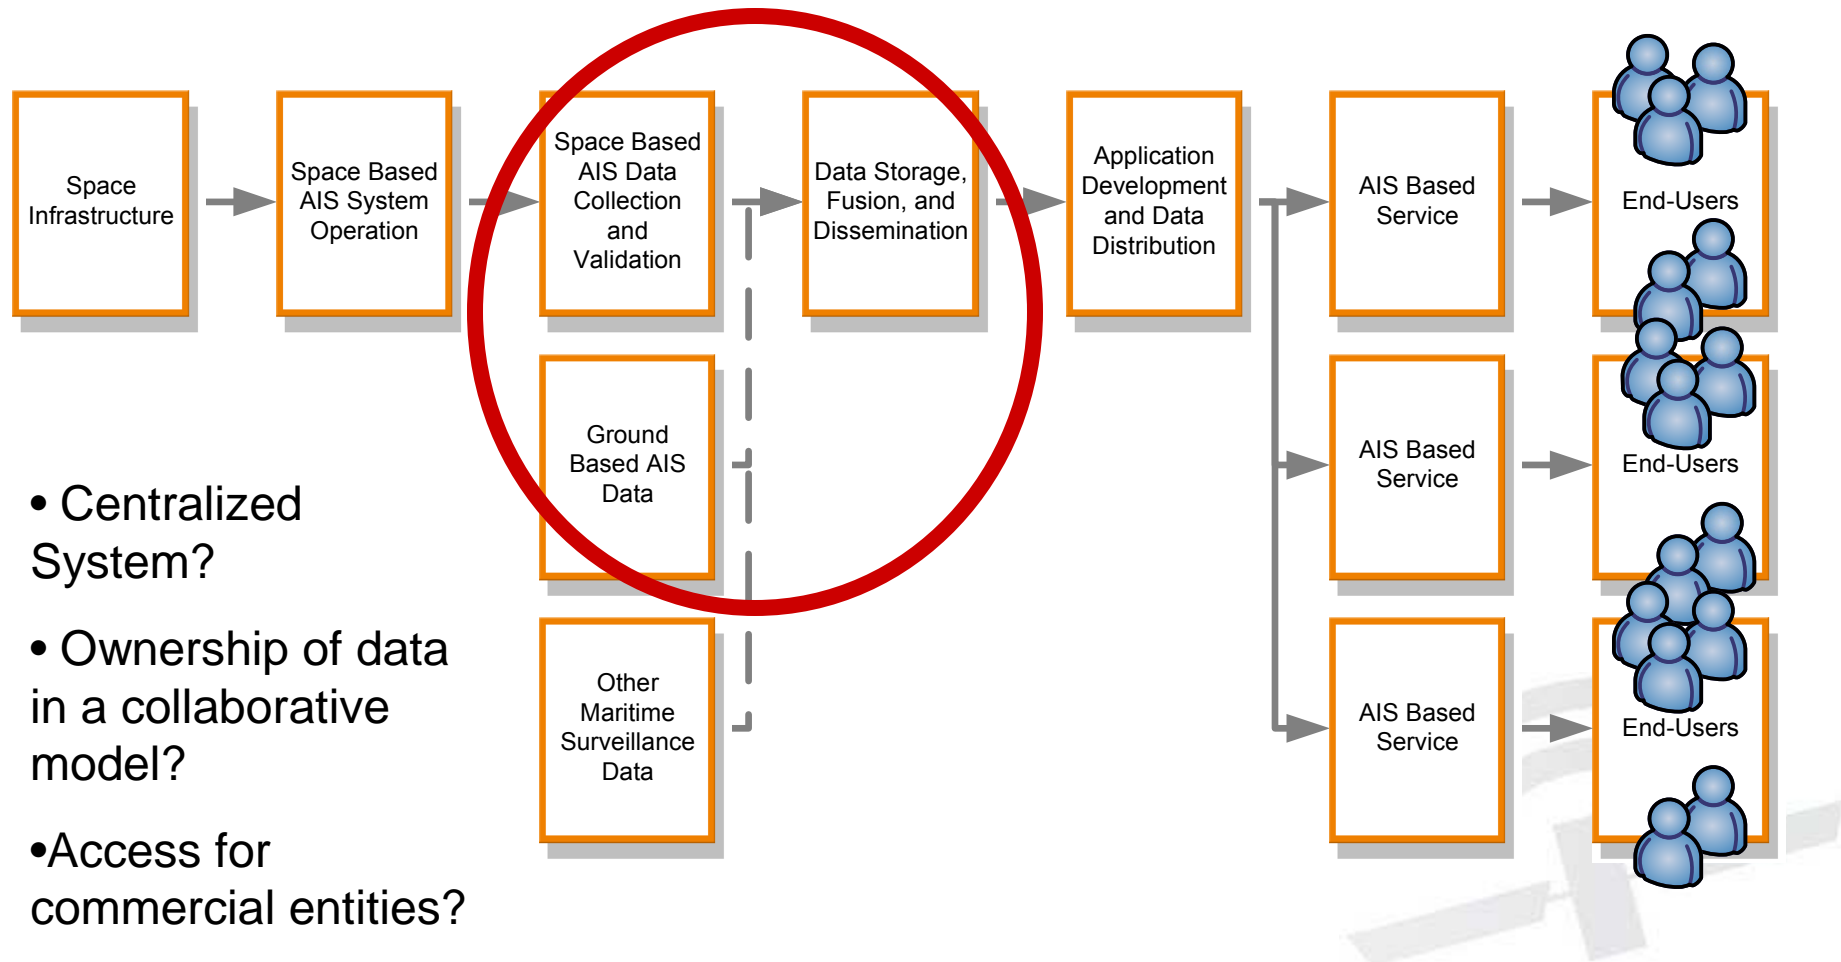

- Harmonizing payload interfaces
- Standardized modules
- Ground station sharing
- Clustered launches
- Functions Sharing
- Fractionating AIS Satellites?

# Organization and implementation

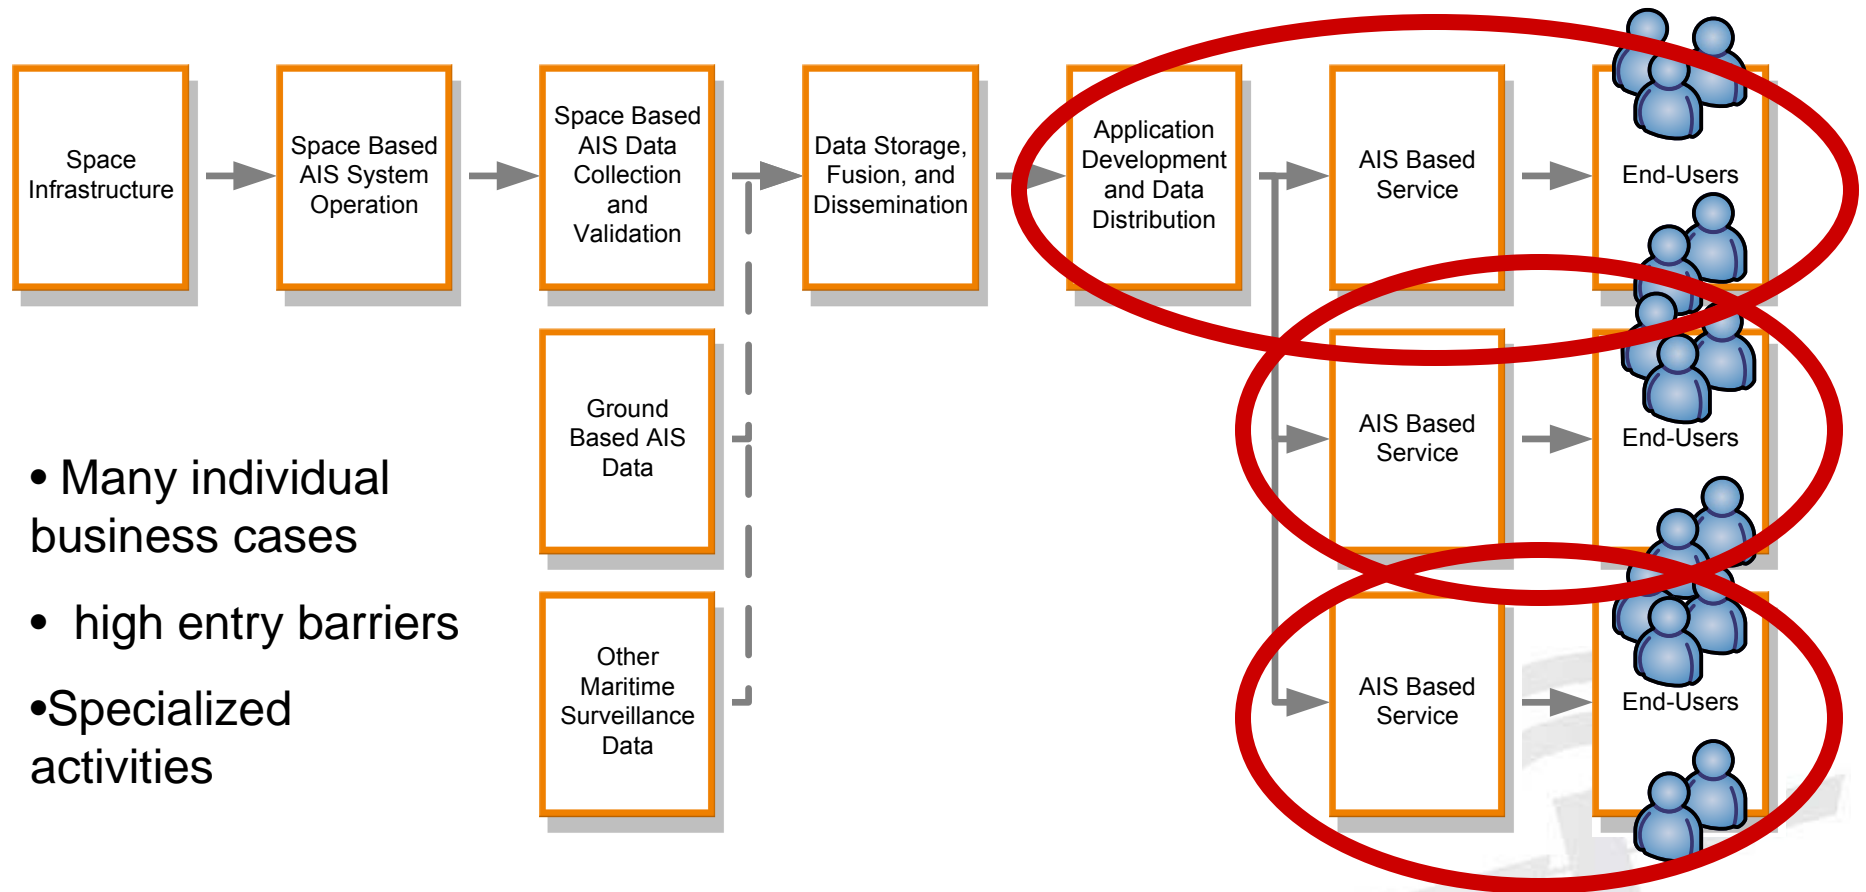

- Consolidation of activities can save cost significantly
- Ground Infrastructure sharing

# Organization and implementation

- Centralized System?
- Ownership of data in a collaborative model?
- Access for commercial entities?

# Organization and implementation

- Many individual business cases
- high entry barriers
- Specialized activities

- Compact, low power AIS receivers allow for low cost Sat-AIS constellations.
- Multiple SAT-AIS architectures working together will enhance results.
- Synergies and intensified cooperation in IPR sharing, infrastructure sharing, can drive cost down for the space segment.
- A centralized data center needs to address several issues with ownership and access rights for commercial entities to continue to invest.
- Individual business cases are difficult to share or integrate.
- Learn from other successful collaborative space system initiatives.

## Conclusions

Thank you for your attention!
